VI-1 Series

ELEGANCE

Foremost, this door is characterized by its innovative hybrid construction, profiting from the inherent advantages of each of its specifically chosen components, such as higher thermal efficiency, greater durability, better functionality and structural stability (with a panel thickness of 57mm / 2 1/4") and all this crowned by a breathtaking look.

You can be assured of optimal protection against the effects of drastic climate changes by an internal, stable fiberglass structure, in combination with a highly insulating polyurethane foam core. The exterior face is constructed from heavy gauge aluminum components, protected by a baked-on, ultra-durable powder coating, limiting exterior maintenance to an absolute minimum. The interior face is built from a selection of solid wood components, by highly trained and devoted carpenters of the 'old school', in classic and traditional styles, and is doted with a professional, furniture quality finish.

Thanks to our highly flexible fabrication setup, a great variety of door models, door sizes and door combinations can be manufactured, providing for a perfect fit of your dream door into any type of opening, for renovation and new construction. The door panels may be solid or glazed. Our special computer program provides great flexibility for accommodating our clients' specific needs. Frame trims are made of solid wood, of various wood species, allowing for a perfect dimensional fit of door frames into masonry openings.

On the exterior, an outer sill of solid granite greatly enhances the appeal of the door, while the warm, natural wood finish on the doors' inner faces, provides a truly exquisite look, embellishing the interior of any home.
